**Ti-Pure™ Titanium Dioxide**

**EU Statement of Compliance for Food Contact Materials for Paper**

The Chemours Company, 1007 Market Street, Wilmington, DE 19801 USA, which manufactures and then imports the following products into the EU via Chemours Belgium BV, hereby declares that the composition of our product identified as:

**Ti-Pure™ Titanium Dioxide Pigments for Paper**
Grade: R-900
Color Index Name: White 6.
Color index Number: 77891

has the following status relative to food contact regulations in Europe:

**European Union:**

Ti-Pure™ titanium dioxide pigments grades are produced according to our quality management system, which complies with the requirements of the Regulation (EC) n° 2023/2006, on good manufacturing practice for materials and articles intended to come into contact with food.

Presuming appropriate processing following the Good Manufacturing Practices Regulation (EC) n° 2023/2006, the above listed Ti-Pure™ titanium dioxide pigment complies with Regulation (EC) n° 1935/2004 as amended, and can be used in the countries of the European Union for the manufacturing of materials and articles intended to come into contact with food.

Presuming appropriate processing following the Good Manufacturing Practices Regulation (EC) n° 2023/2006, the above listed Ti-Pure™ titanium dioxide pigment complies with Regulation (EC) n° 1935/2004 as amended, and can be used in the countries of the European Union for the manufacturing of materials and articles intended to come into contact with food.

In absence of EU harmonised legislation for paper and board materials and articles foreseen to come into contact with food, the existing material specific legislation in the different EU Member states applies. An overview of the EU Member State legislation is shown below:

**European Legislation**

Comply with the following regulatory requirements:

**Germany – BfR:** BfR Recommendation XXXVI (including XXXVI/1 and XXXVI/2) (Paper and Board for Food Contact), dated April 1\textsuperscript{st} 2022. BfR Recommendation LII. Fillers, section 3 (purity requirements) dated June 1\textsuperscript{st} 2019.

**Netherlands:** “Commodities Act (Packaging and Utensils Decree)” of Jan 1\textsuperscript{st} 2017, as last amended on April 26\textsuperscript{th} 2022, Chapter II Paper and cardboard & XI Colorants and pigments section 3 (Purity criteria on pigment/colorants), section 4.a (requirements for the pigmented end product).

Except for aluminum, none of the elements listed in section 4.a are intentionally added, but trace amounts of certain elements may be present.

With the exception of ionic aluminum, section 4.a substances are below the listed SML’s (except for Hg where the LOQ is 0,01 mg/kg) in accordance with migration testing performed directly on pigment under severe testing conditions for metals migration (3% acetic acid food simulant, 4 hours at 100 °C followed by 10 days at 60 °C, no polymer matrix).

Ionic aluminum migration under the prescribed severe testing conditions, exceeded the migration limit of 1 mg/kg food of ionic aluminum. As these are tests performed directly on pigment, they are highly precautionary. When incorporated in polymer in the form of an article the migration is substantially lower.

The migration of aluminum ions from non-polar polymers is typically less than 0.1 mg/kg food. However, uses in polar polymers, where swelling occurs in contact with food stuffs simulated by 3% acetic acid, should be limited to conditions that do not exceed the Al SML of 1 mg/kg food.
Hence we advice that materials and articles produced with these grades in polar polymers should be verified for compliance with the ionic aluminum migration limit of 1 mg/ kg food.

There are no known sources of Primary Aromatic Amines (PAA) in the production process of titanium dioxide, and hence PAA are not expected to be present.

Switzerland: DFI Swiss Ordinance 817.023.21 of 16 December 2016, as amended and last updated on Dec. 1st 2020 on materials and articles foreseen to come into contact with food stuff; including:

- The general provisions outlined in Chapter 1, 2 and 3; and
- The provisions for paper and cardboard outlined in Chapter 9: no specific requirements for pigments

In accordance with the principle of mutual recognition as outlined in Art.34 - 36 of the Treaty on the functioning of the European Union (TFEU), the incomplete compliance of a product with legislation in one EU member state, does still allow the product to be placed on the market in the European Union on the basis of its full compliance in at least one Member State of the European Union.

Council of Europe: Resolution AP (2002)1 “Paper and board materials and articles intended to come into contact with foodstuffs,” Technical Document No. 1, List 1 of additives covers titanium dioxide as well as the substances used in coatings on pigments.

The above resolution was adopted by the Committee of Ministers, in its composition restricted to the Representatives of Austria, Belgium, Cyprus, Denmark, Finland, France, Germany, Ireland, Italy, Luxembourg, The Netherlands, Norway, Portugal, Slovenia, Spain, Sweden and Switzerland. It recommends that concerned governments take into account in their national laws and regulations the principles and/or the analytical methods and/or the inventory lists set out in these resolutions.

### Additional information

#### Specification of Use

There are no Specifications of Use for any of the substances in Ti-Pure™ titanium dioxide pigments.

#### Future Harmonized Legislation

Chemours intends to take all action required to have all relevant constituents of above mentioned Ti-Pure™ products covered by appropriate EU positive lists when harmonized legislation is promulgated.

### Notes

1. Severe Metals Migration Testing in the Absence of Polymer Matrix

Metal migration testing from pigment was performed following the principals of EN 13130:2004; however, in the absence of a polymer matrix. Briefly, the pigment to food simulant concentration was calculated using the prescribed plastic article surface area to food simulant ratio of 6 dm$^2$ to 1000 ml food simulant and the standard assumption that migration comes from the first 0.25 mm of the surface of said article. For this calculation, a mass fraction loading of 25% was used for the pigment content. Testing was performed using conditions considered as severe for complying inserted to any time and temperature specification (4 hours at 100 °C followed by 10 days at 60 °C) in 3% acetic acid. The results from this method are typically much higher versus tests performed in non-polar polymers (LDPE) and typically in the range order of magnitude greater than similar testing results obtained from studies performed in polar polymers that swell in the 3% acetic acid food simulant for the same time/temperature regiment (e.g., polyacrylamide).

**Table 1. Comparison of Al migration data for the method above versus standard testing protocols**

End-Use Testing
Manufacturers using the above products for the fabrication of paper materials and articles intended to come into contact with food, must comply with the general principles or regulatory requirement that these materials and articles should not, by reason of their coloration, pose a risk to human health or bring about either a deterioration in the organoleptic characteristics or other unacceptable changes to the food which they come into contact with. Colorants should be sufficiently integrated within the paper materials and articles so as to preclude migration into foodstuffs under normal conditions of use, as determined by an appropriate method.

The present review only refers to food-contact applications.

Ti-Pure™ products may not be directly added to food, pharmaceuticals, cosmetics, or cigarette papers/filters for tobacco products. Ti-Pure™ products may not be used in the manufacture of any medical device for implantation in the human body without prior written agreement of Chemours.
